

Themes

Change the colors. Light, dark, auto-switch, or colorblind-friendly. The fastest customization on this list.

What it does

Claude Code has its own color palette, separate from your terminal. You pick the theme and it changes immediately — no restart, no file editing. Good for matching your mood, your room's lighting, or an accessibility need.

Why it's fun

It's the easiest one. Takes five seconds. Completely changes the feel of the interface.

How to set it up

Option 1: Interactive — type `/theme` inside Claude Code and pick from a menu.

Option 2: Permanent — add this to `~/.claude/settings.json` :

```
{
  "theme": "dark"
}
```

All theme options

Theme	When to use it
"auto"	Follows your macOS system setting (dark at night, light by day)
"dark"	Classic dark mode — default for most people
"light"	High-contrast light — great for daylight, projectors, screenshots
"dark-daltonized"	Dark + colorblind-friendly (for red-green color differences)
"light-daltonized"	Light + colorblind-friendly
"dark-ansi"	Dark using your terminal's ANSI colors (match your terminal theme)
"light-ansi"	Light using your terminal's ANSI colors

Fun ideas to try

- `auto` — lets your environment decide; feels like Claude is paying attention
- `light` for recording videos or taking screenshots — dark themes photograph poorly
- `dark-daltonized` if you've ever struggled to tell green from red in test output
- `dark-ansi` if you already love your terminal theme and want Claude to match

Heads up

Themes change instantly — no restart needed. If you can't read something, just run `/theme light` (or `/theme dark`) and it switches on the spot.
